

ADITYA PODDAR

Full Stack Developer | React · Node.js · MongoDB (MERN) · Next.js

Open to Remote/Hybrid/On-site | +91 78924 81668 | adityapoddar7309@gmail.com | [LinkedIn](#) | adityapoddar.site

SUMMARY

Full Stack Developer (MERN) with production experience shipping a SaaS platform used in the wild, plus hands-on work across AWS (EC2, S3, IAM, API Gateway, Amplify), Docker, and CI/CD automation. Comfortable owning a feature from database schema to cloud deployment. Currently deepening skills in system design, PostgreSQL, and containerized real-time services.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, Java, HTML5, CSS3

Frameworks & Libraries: React.js, Next.js, Node.js, Express.js, React Context API, Tailwind CSS, Material UI

Cloud & DevOps: AWS (EC2, S3, IAM, API Gateway, Amplify), Docker, GitHub Actions (CI/CD), Vercel, Render, Jest

Databases: MongoDB Atlas, Mongoose ODM, SQL

Security & Tools: JWT, bcrypt.js, REST API design, Git, GitHub, CORS

WORK EXPERIENCE

Full Stack Developer — Yuva Nexus Technologies LLP

Nov 2025 – Present

Software Development Intern (May 28 – Oct 28, 2025) — converted to full-time via PPO, effective Nov 1, 2025. Continuous tenure since May 2025.

- Architected and shipped calculators.lol, a SaaS platform of 400+ analytical tools, from scratch to production — using Next.js Static Generation and the Metadata API to maximize SEO reach and minimize page latency.
- Built responsive, high-performance UIs with React, Next.js, and Tailwind CSS, applying code splitting and Core Web Vitals optimization to keep load times fast at scale.
- Designed and integrated RESTful APIs powering complex front-end features, keeping the codebase modular and maintainable as the tool catalog grew past 400 tools.
- Automated real-time client communication workflows using Resend API, improving delivery reliability.

PROJECTS

CodePulse — Full-Stack Version Control System

Node.js, React, Express.js, MongoDB, AWS (EC2, S3, IAM, API Gateway) [Live demo](#)

- Built a Git-inspired VCS from scratch: a custom Node.js CLI (yargs, chalk.js) supporting init, add, commit, push, pull, and revert, mirroring Git's separation of object storage from refs.
- Decoupled commit blob storage (AWS S3) from repository metadata (MongoDB Atlas), keeping the database lean while S3 scaled cheaply with file volume.
- Designed a production AWS pipeline (Amplify → API Gateway → EC2) to serve an HTTPS frontend against an HTTP backend, with IAM-scoped credentials ensuring only the server — never the browser — accessed S3 directly.
- Implemented JWT + bcrypt authentication, full repository CRUD, a many-to-many starring system, and a GitHub-style contribution heatmap driven by repository activity data.

DevGPT — Full-Stack AI Chat Assistant

React, Node.js, Express.js, MongoDB, GitHub Actions [Live demo](#)

- Built a full-stack AI chat assistant with persistent, multi-thread conversation history, secure JWT-authenticated sessions, and a live word-by-word response renderer for replies from the OpenRouter API.
- Designed and shipped a fully automated CI/CD pipeline with GitHub Actions and self-hosted runners, enabling independent, zero-downtime deployments of the frontend (Vercel) and backend (Render) on every merge.
- Rendered rich AI responses with react-markdown and rehype-highlight (tables, syntax-highlighted code blocks) and enforced CORS-locked API access for production security.
- Maintained continuous production uptime through structured error handling and JWT-protected middleware on every authenticated route.

EDUCATION

M.Sc. Physics — Central University of Karnataka

B.Sc. — Gulbarga University

Full Stack Web Development Certification — Apna College, 2025
